Dell Services
Server Implementation

Let Dell rapidly deploy your new Dell Server products to save you time and effort.

Server implementation can be complicated, expensive and require extensive planning.

You have spent valuable resources acquiring the right technology for your organization. Provisioning new server products quickly without disrupting operations or end users is key to begin realizing returns on your investment. Unfortunately, taking the time to set up the systems yourself can be costly, time and resource intensive, and an inefficient use of your IT staff 's time.

Expertly implementing your server products.

Dell Services can provide the expert knowledge and products to get your new server products up and running quickly. To minimize installation time, Dell Certified Technicians use proven methodologies. We provide a wide range of standard server installation and implementation options to meet your needs, no matter how many locations you have throughout the world. Dell's standard deployment offers meet most organization's requirements but we can design a custom solution if needed.

- **Experience less downtime**: Dell certified technicians apply a consistent deployment methodology to significantly reduce variance in execution.

- **Free up internal IT resources**: Dell can take responsibility for all aspects of your deployment, helping eliminate time consuming internal implementation tasks and deployment costs.

- **Minimize disruption with on-site or remote delivery options for services**: Dell provides many options – from onsite assistance to full custom factory set up. The rack arrives at your site customized to your needs and ready to provision, helping reduce interruptions to your operations.

- **Speed time to production** by leveraging tools and processes, such as Custom Enterprise Factory Integration so that systems arrive ready to provision.

Dell certified technicians can augment customers deployment activity or own the entire process from start to finish so your IT staff is able to use their expertise where it is needed most, handling their strategic business objectives.

Dell Server Implementation

Dell provides a comprehensive set of remote and on-site installation and implementation services for your Dell server products to help you get from purchase order to production faster.

- **Data Center Solutions**
  Hyperscale environments which require large server volume such as virtual server farms, HPCC, or social media sites, need to be custom designed and built from the ground up. Our team of system architecture and power and thermal experts have deep industry knowledge and can engage engineer-to-engineer to design unique solutions optimized for each customer. Our global reach enables us to help you lower your total cost of computing anywhere in the world.

- **Custom Enterprise Factory Integration**
  Dell can free your IT staff from implementation complexity by performing much of the problem solving in our factory rather than at your location. Prior to shipping, we can mount your server or storage systems into a rack, finish the cabling, as well as install and test your applications, all at our factory. The rack arrives at your location completely assembled and ready to provision. This reduces onsite deployment time and post-installation waste clean-up at your site.

- **Remote Deployment**
  Dell also offers remote deployment for new or existing Dell PowerEdge products. Through a secure Internet connection, we can remotely configure your new server to your specifications. PowerEdge is a cost effective and efficient way to integrate your new Dell server products into your environment.

- **Standard Server Installation**
  On-site deployments include the physical installation of your system, installation of Dell Power Distribution Units (PDUs), basic diagnostics testing, configuration of the hardware, installation of your Dell supported NOS, and connection of the server to your network. Dell can also provide basic rack mounting services when no integration is needed.

Server Implementation Services

Our comprehensive Server Implementation services are designed to give you an end-to-end server deployment solution. Dell can configure and test your new Dell servers, as well as mount them into a Dell-supported rack. Dell provides on-site Server and NOS Installation services including Microsoft® or Novell® operating systems. If you do not need the extensive offering of our Server Implementation services, we can provide basic server set-up. We can perform a system test as well as install your new server into a Dell-supported rack.

Switch Installation Services

Dell offers complete data networking switch installation including Dell PowerConnect, Brocade, Juniper, and Cisco. We will connect cables between the switches and attached servers and clients as well as test them to make certain they are properly connected. Plus, we mount them into a Dell-supported rack. Dell can also provide managed switch installation with advanced feature configuration.
