

PowerEdge R940

Report produced February, 2019

From design to end-of-life and everything in between, we work to improve the environmental impact of the products you purchase. As part of that process, we estimate the specific impacts throughout the lifecycle. This includes the contributions from materials, manufacturing, distribution, use and end-of-life management.

This product's estimated carbon footprint:

14100 kgCO₂e *

Estimated impact by lifecycle stage:

Dell uses PAIA (Product Attribute to Impact Algorithm) to perform product carbon footprints. PAIA is a streamlined LCA tool developed by [MIT's Materials System Laboratory](#). It takes into consideration important attributes of the product which can be correlated to activities in order to calculate the product carbon footprint.

Due to high configurability of servers, the information provided here was calculated based on the products highest selling configuration (see assumptions on page 2).

Est. product carbon footprint, page 1

PowerEdge R940

* This product has an estimated standard deviation of +/- 15500 kgCO₂eq

As part of our commitment to transparency, the chart to the right demonstrates the degree of uncertainty that exists within the PAIA model for product carbon footprinting, based on assumptions we have made for select variables.

Assumptions for calculating product carbon footprint:

Product Weight	44 kg	Server Type	Rack	Assembly Location	EU
Product Lifetime	4 years	Use Location	EU	Energy Demand (Yearly TEC)	3012.126 kWh
HDD/SSD Quantity	x2 300GB 2.5" HDD x4 2TB 2.5" HDD	DRAM Capacity	64BG	CPU Quantity	2

14100
kgCO₂e

To help our customers and other stakeholders contextualize product carbon footprint values, we provide these approximate equivalencies. Please remember these are estimates and should not be used for emission inventory or formal carbon footprinting exercises.

1 of these products...
has a footprint approx.
equivalent to **driving 34,545 miles** in a passenger car.

10 of these products...
have a footprint approx.
equal to what **166 acres of US forests** can absorb
in a year.

100 of these products...
have a footprint about the
same as the annual
average carbon footprint
of **282 people**.

Calculations are based on the following methodologies: 2.45 miles driven per 1 kg co₂e (source: [U.S. EPA](#)); approx. 850 kg co₂e absorbed per acre of forests over a year (source: [U.S. EPA](#)); global personal carbon footprint estimated at 5 MTco₂e per person (source: [World Bank](#)).
