

Dell Precision 7865 Tower

Offering ideal configurations for Software Development

Like many industries, the demands on software developers continues to rise. From ultra-realistic imagery, a constant need for more data, and our demand for ever better performance, designing and maintaining software that meets the expectations of users continues to be a challenging task for companies of all sizes.

Whether you're working on the latest customer enablement initiative using Webapps, or attempting integration of generative AI, the new Precision 7865 Tower with AMD Ryzen™ Threadripper™ PRO processors has what you need to get the job done without needing to worry about timeouts or system crashes.

Say goodbye to missed deadlines and last minute cram sessions!

AMD Ryzen™ Threadripper™ PRO Processors

Software engineers often face long compile times, especially on projects of ever-increasing size. Software compilation is a multi-threaded process that benefits from additional processing cores and GPU compute.

The AMD Ryzen™ Threadripper™ PRO processors can help reduce that compilation time, with processors carrying up to 64 cores as well as 128 PCIe® lanes for supporting a wide range of GPUs and other expansion cards.

Solutions utilizing the AMD Ryzen™ Threadripper™ PRO processors can help engineers reach insights and resolve obstacles quickly.
